Can our sample detect mate limitation? (simulation; dotted line = 80 %)
A. D1 model populations — designs compared
D1, every fit deme sampled — 158 mothers
D1 plan, P34 only — 84 mothers
D1 plan, P36 only — 7 mothers
D1 plan (selected demes) — 91 mothers
D1 plan + every adult of the selected demes genotyped — 90 mothers
Chance of detecting mate limitation
How much less seed a mother sets with half the usual share of compatible mates (%)
B. How many mothers does the test need?
Effect: with half the compatible mates
10 % less seed
20 % less seed
30 % less seed
50 % less seed
D1 plan size
all 1061 mothers held
(58 population-seasons)
Mothers genotyped, drawn across every population sampled well enough
