1. Prioritize populations for population restoration

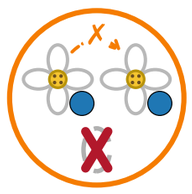

AVOID

over-producing

inbreeding depression

→ excluded as a seed source

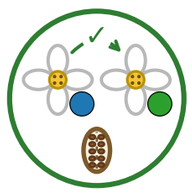

TARGET

mate-limited

too few compatible mates

→ genetic rescue (objective 3)

INTACT

reproductively intact

enough compatible mates

→ seed source (step 2): protect

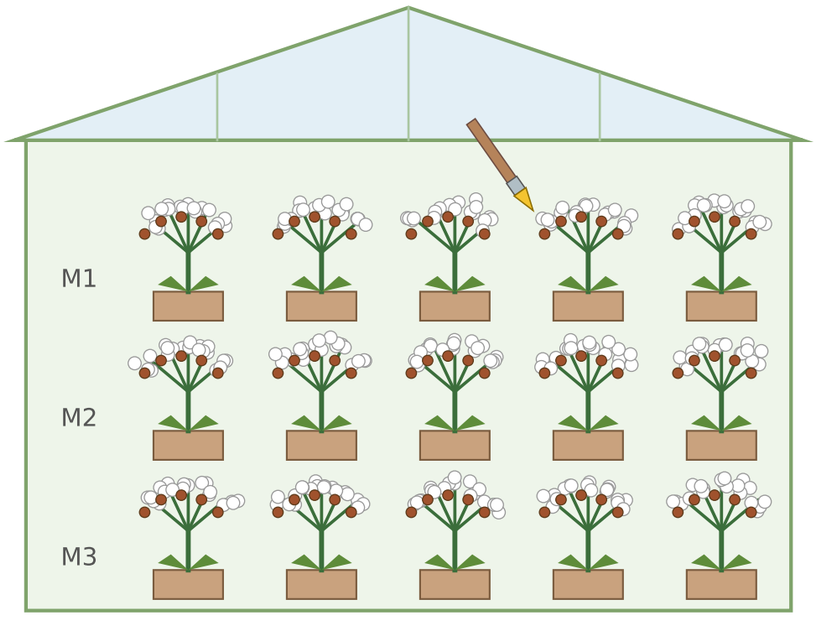

population = the plants that mate together (the mating pool)

technique: seed set for plant size (see Figure 4)

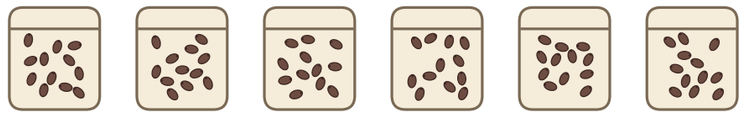

2. Multiply seed

from sources

many seeds

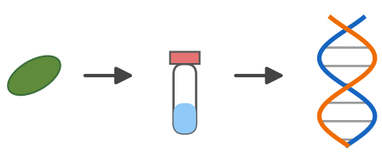

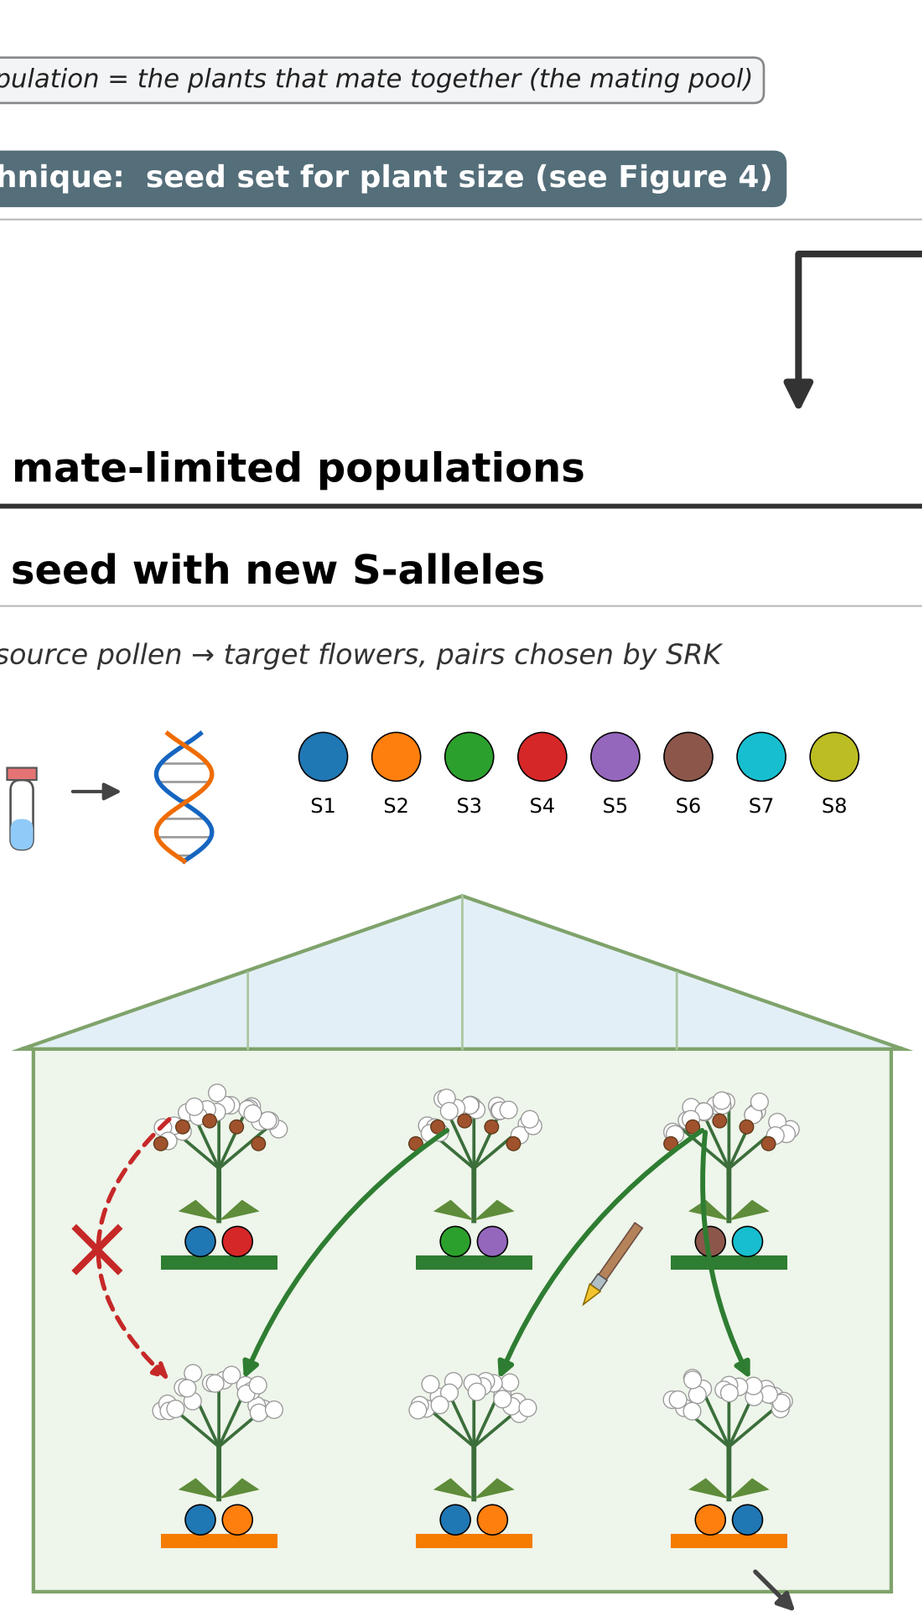

technique: seed bulking (greenhouse)

3. Rescue mate-limited populations

3a. Breed seed with new S-alleles

source pollen → target flowers, pairs chosen by SRK

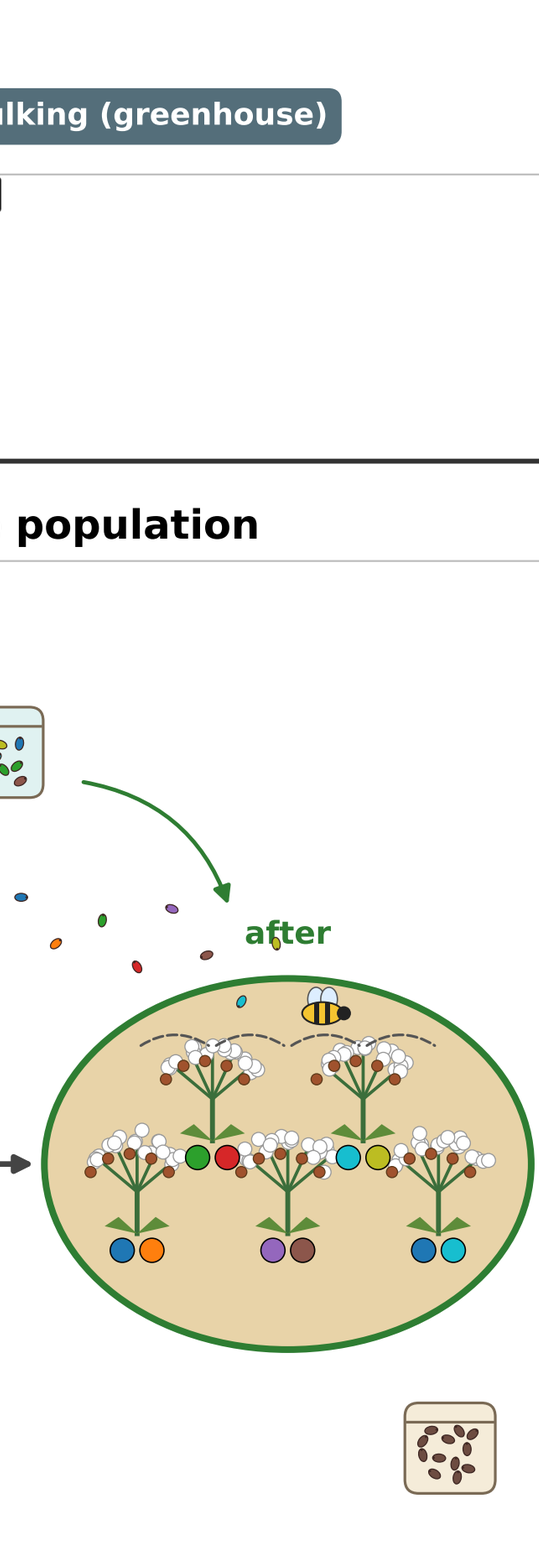

seed with new S-alleles

technique: informed breeding (SRK)

3b. Sow the seed into the population

monitor

technique: seed outcasting
