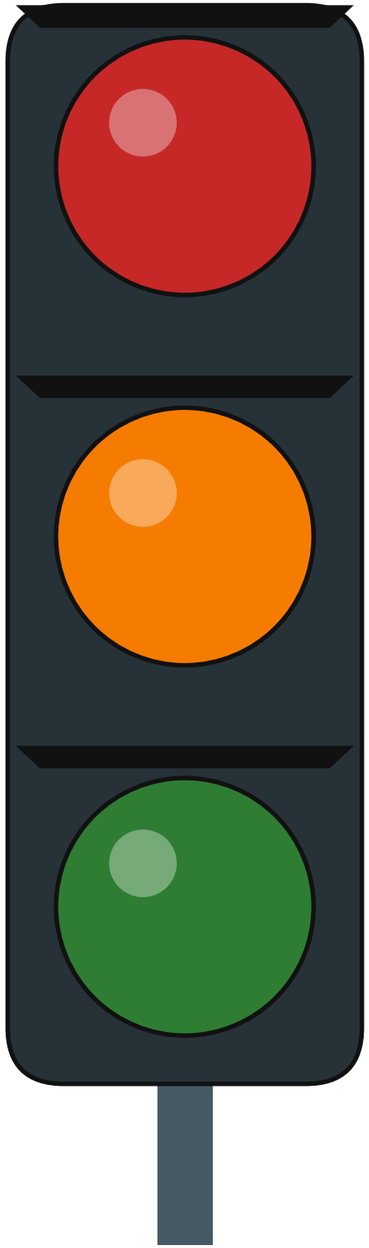
Prioritizing EOs for the species recovery plan

Recovery Criterion 2: at least 100 EOs persist over 12 years, at least 75 of them in fair to excellent condition



AVOID

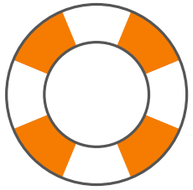
do not use as a seed source

plants set more seed than expected for their size,
likely by pollinating themselves

TARGET

restore — bring in new genetic diversity

plants set less seed than expected for their size



INTACT

conserve — the seed source for restoration

plants set the seed expected for their size

Each EO is categorized by how its populations reproduce (seed set for plant size), then confirmed with genetics
