1. Survey slick spots holding reproductive plants — each season

Each slick spot surveyed in a season is an event; its reproductive plants are counted. Some slick spots are not above ground every season.

group slick spots < 50 m apart, each season

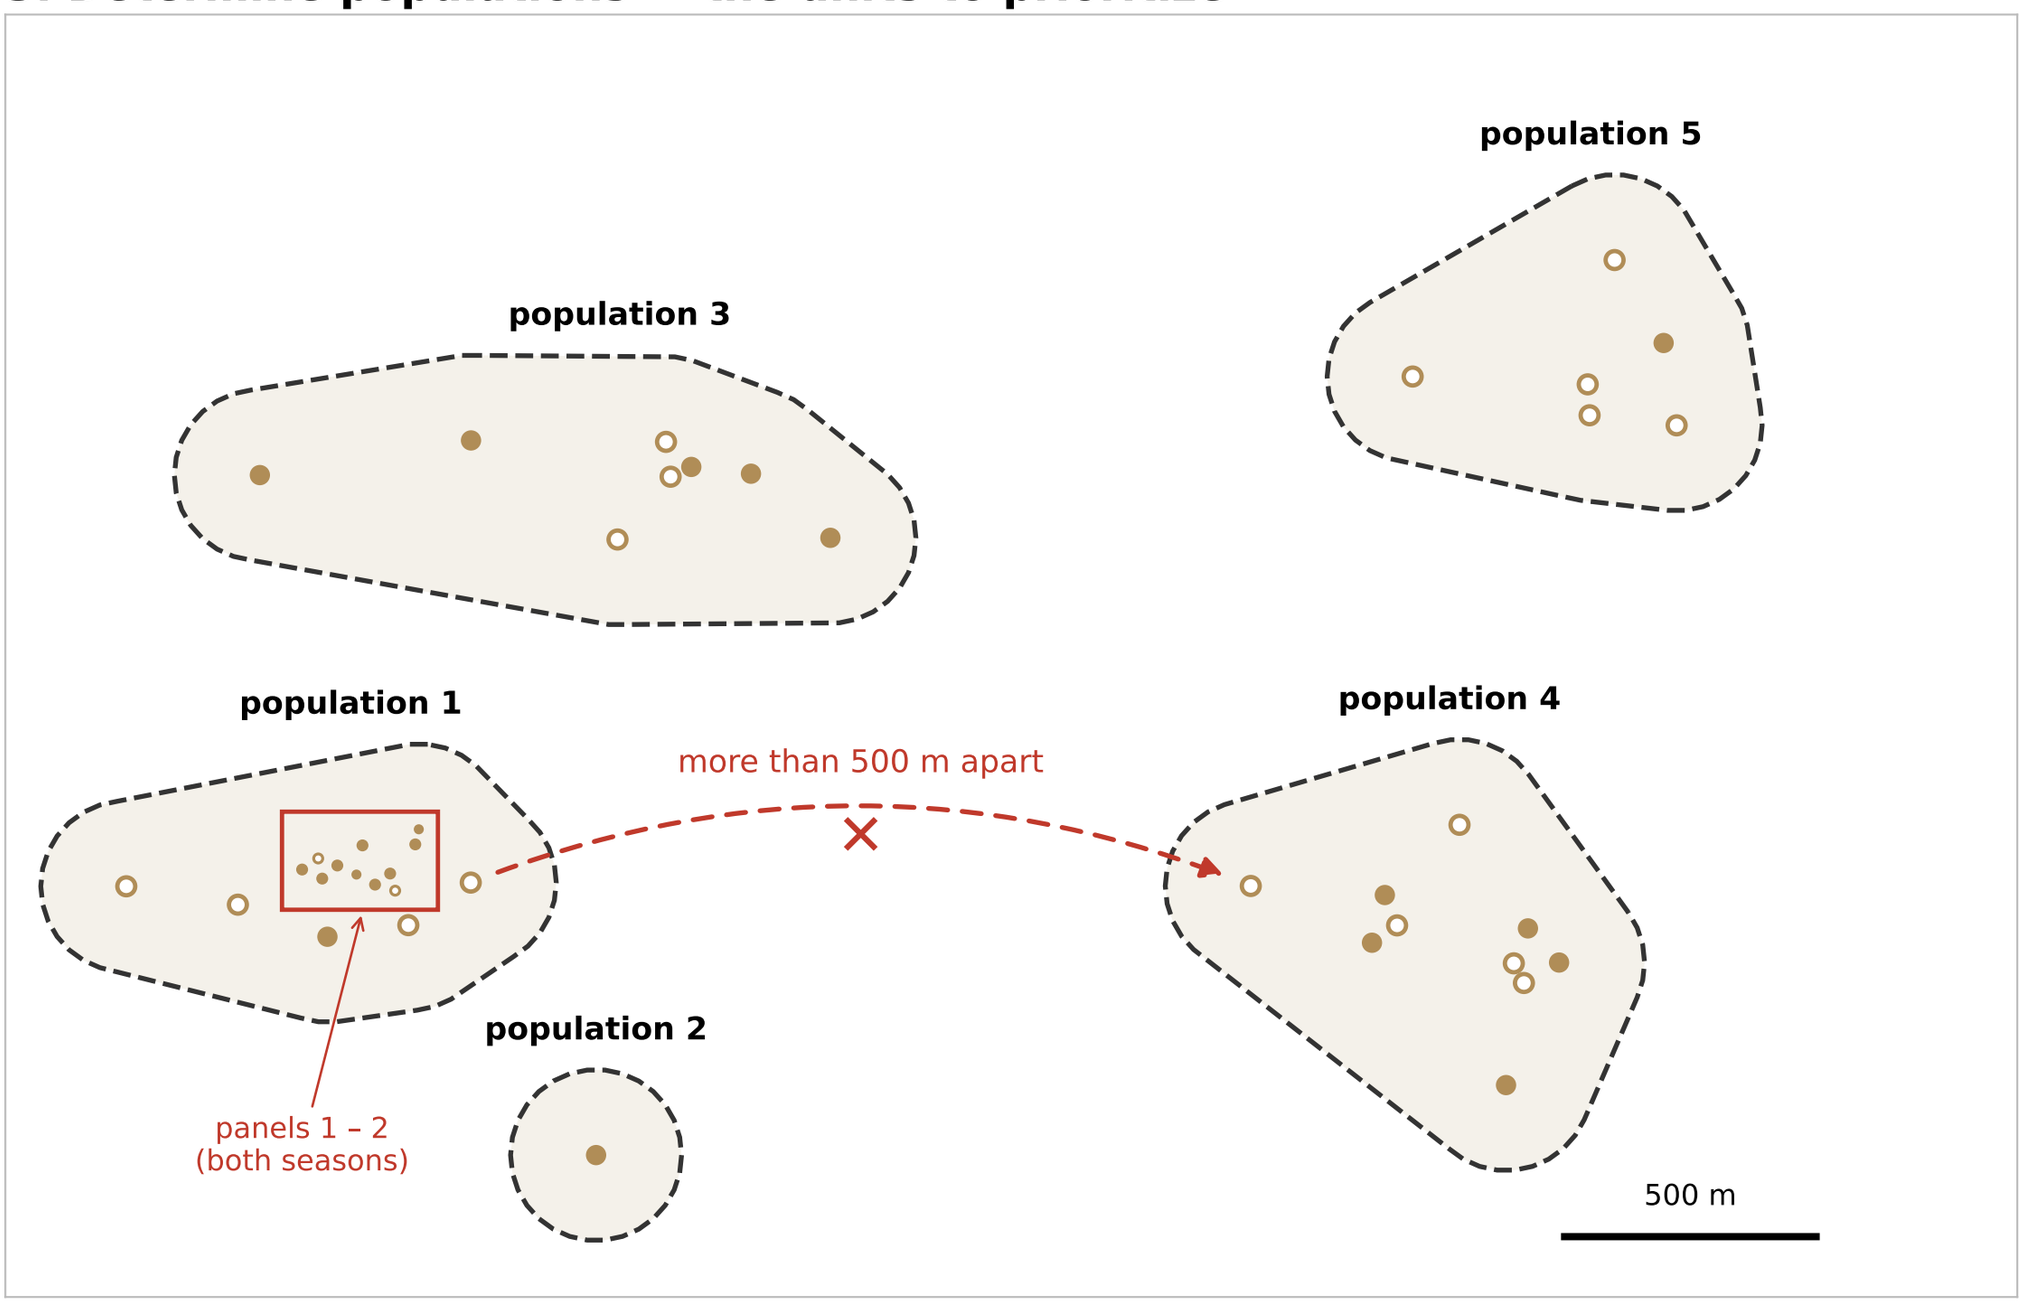

2. Determine the mating pool (demes) — each season

Plants less than 50 m apart (pollinator flight) can mate: their slick spots form one deme, the mating pool, redrawn each season.

combine both seasons; link slick spots
< 500 m apart (maximum pollinator dispersal)

3. Determine populations — the units to prioritize

Slick spots of all seasons (here 2025 and 2026) less than 500 m apart (maximum pollinator dispersal) form one population, the unit to prioritize.

Schematic — positions are invented, not a real site.
