1. Slick spots (events) — each season

Each slick spot surveyed in a season is an event; its flowering plants are counted. Some slick spots are not above ground every season.

group slick spots < 50 m apart, each season

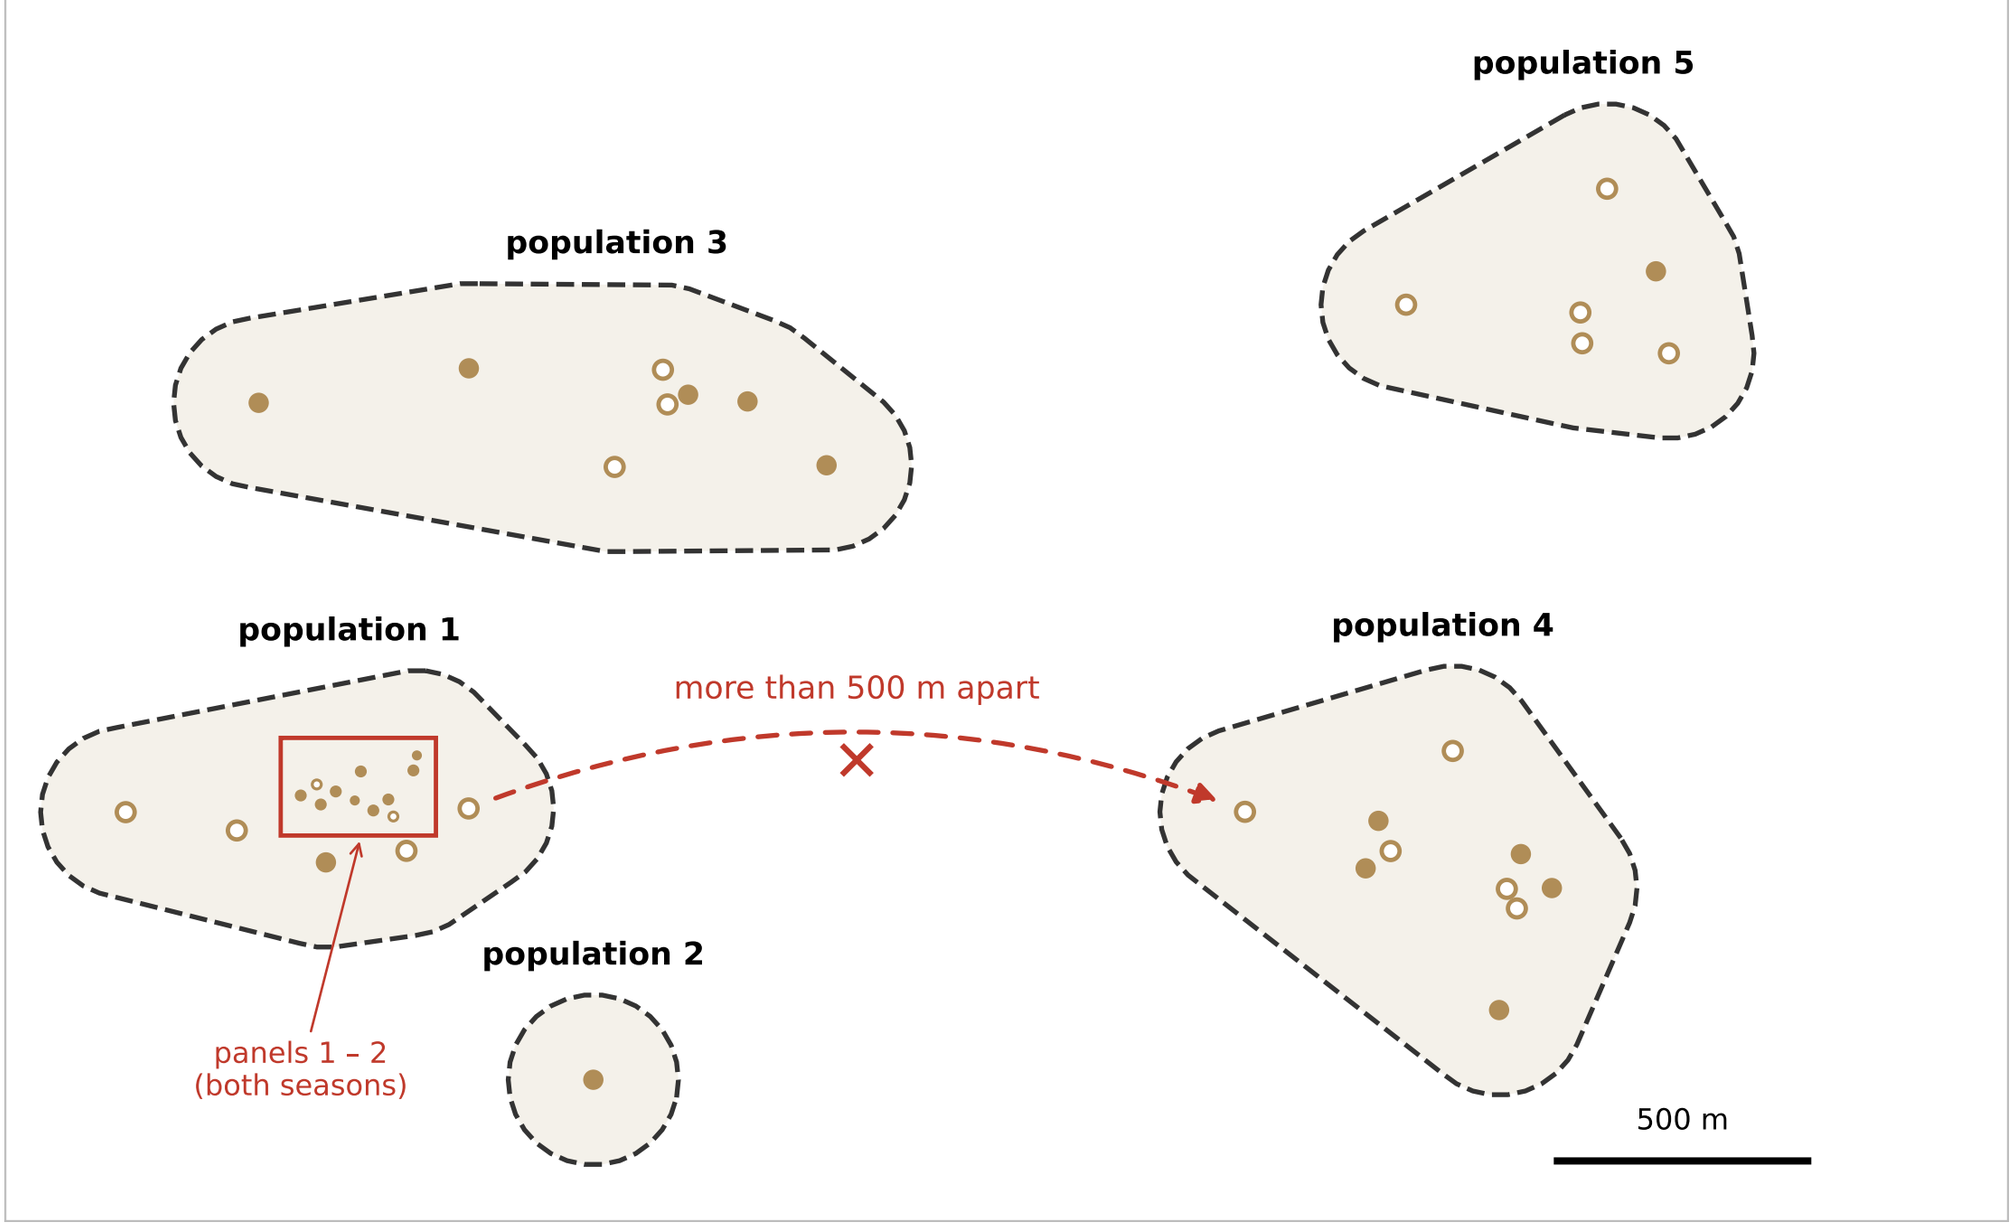

2. Demes — within each season

Pollinators move between slick spots less than 50 m apart, which then form one deme; demes are redrawn each season.

combine both seasons; link slick spots < 500 m apart

3. Populations — seasons combined

Slick spots of all seasons (here 2025 and 2026) less than 500 m apart form one population; its demes are redrawn each season.

Schematic — positions are invented, not a real site.
