## The challenge: very few seeds to start with

*wild populations: few fruits — most likely reproductive failure*

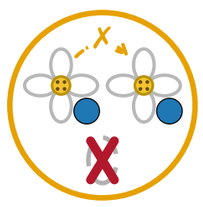

## 1. Prioritize populations for population restoration

**reproductively intact (source)**

**top conservation priority: protect**

**mate-limited**

→ rescue (objective 3)

**rescue**

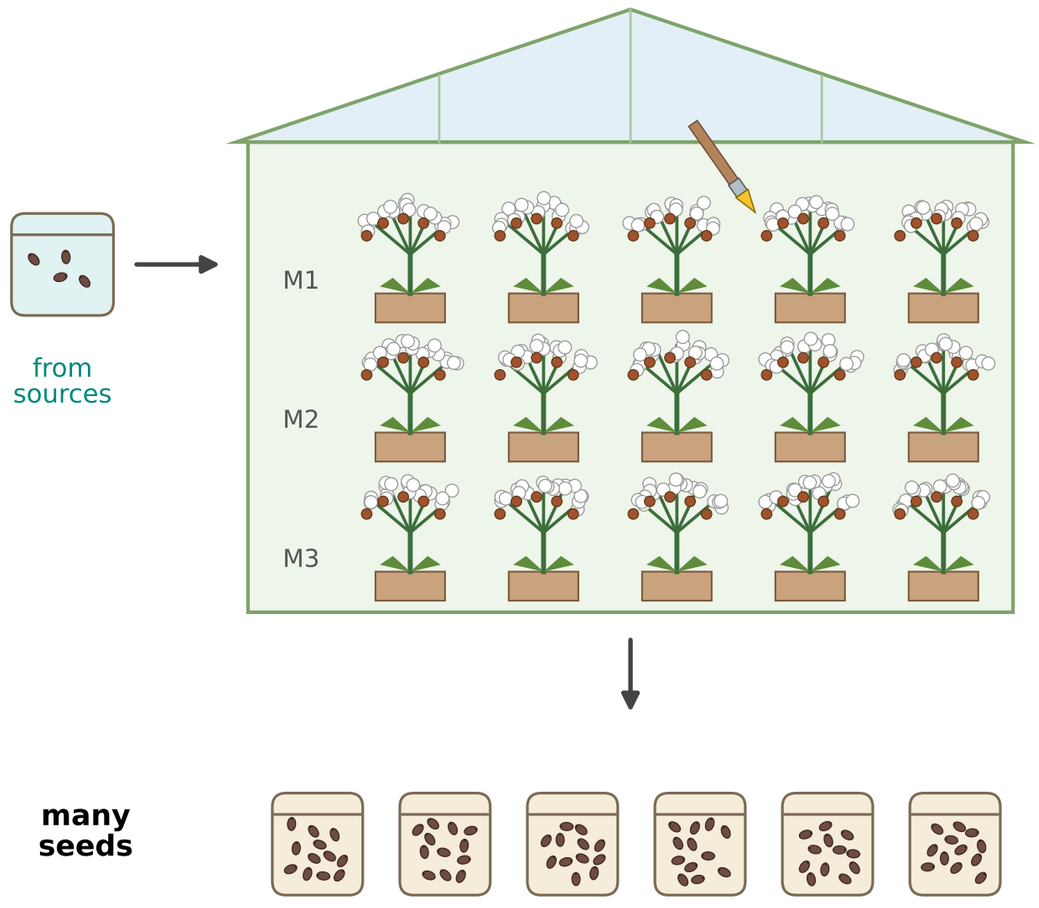

**over-producing**

→ inbreeding depression: excluded as source

**avoid**

**technique: seed set for plant size (see Figure 3)**

## 2. Multiply seed

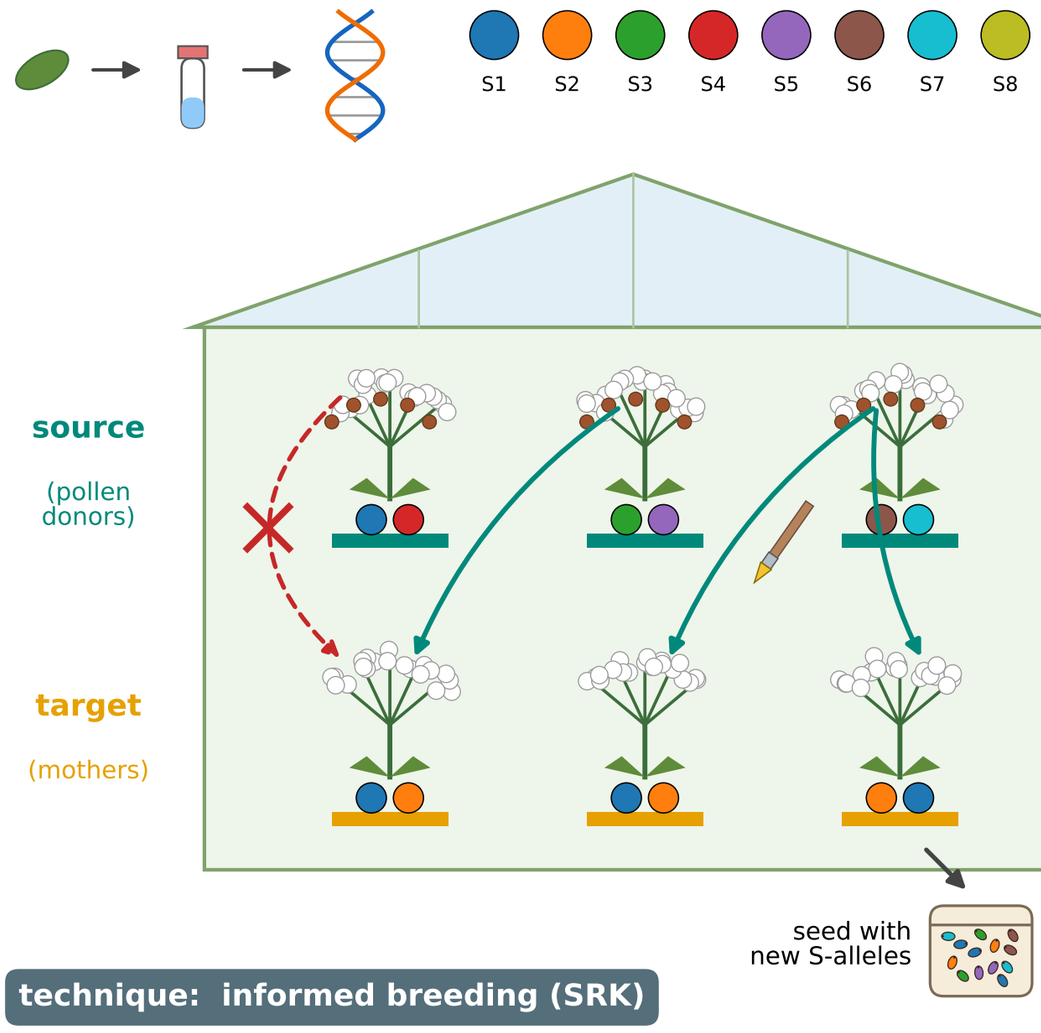

**technique: seed bulking (greenhouse)**

## 3. Rescue mate-limited populations

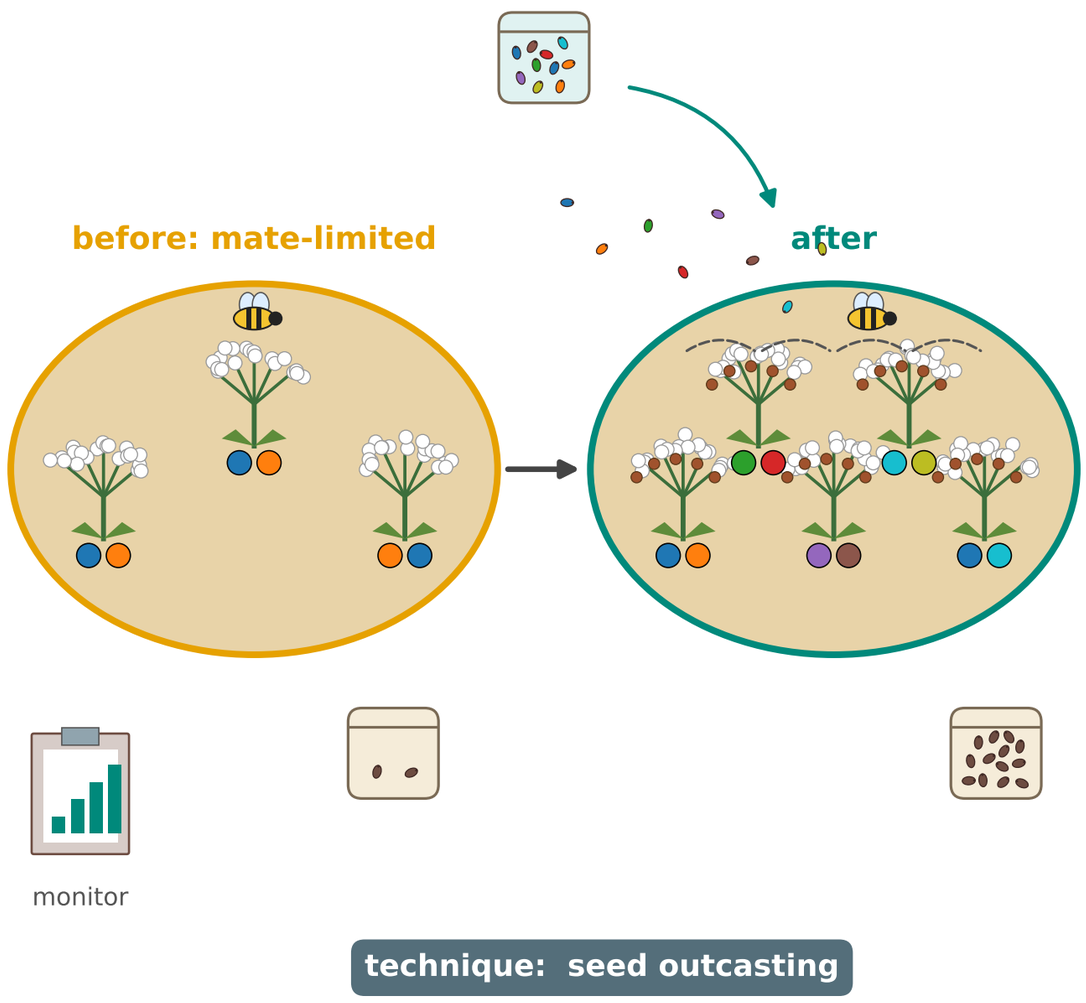

### 3a. Breed seed with new S-alleles

*source pollen → target flowers, pairs chosen by SRK*

**technique: informed breeding (SRK)**

### 3b. Sow the seed into the population

**technique: seed outcasting**
