The challenge: very few seeds to start with

wild populations: few fruits — most likely reproductive failure

very few seeds

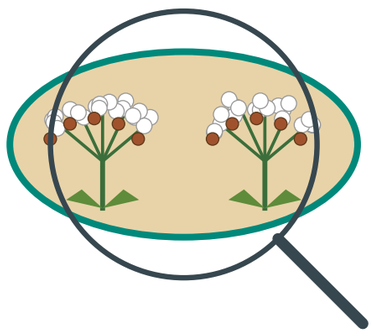

→ too few to restore directly

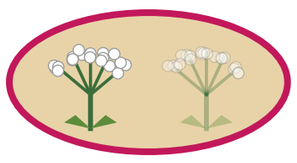

1. Prioritize populations for population restoration

reproductively intact (source)

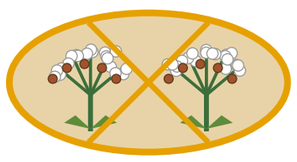

top conservation priority: protect

mate-limited

→ rescue (objective 3)

inbreeding depression

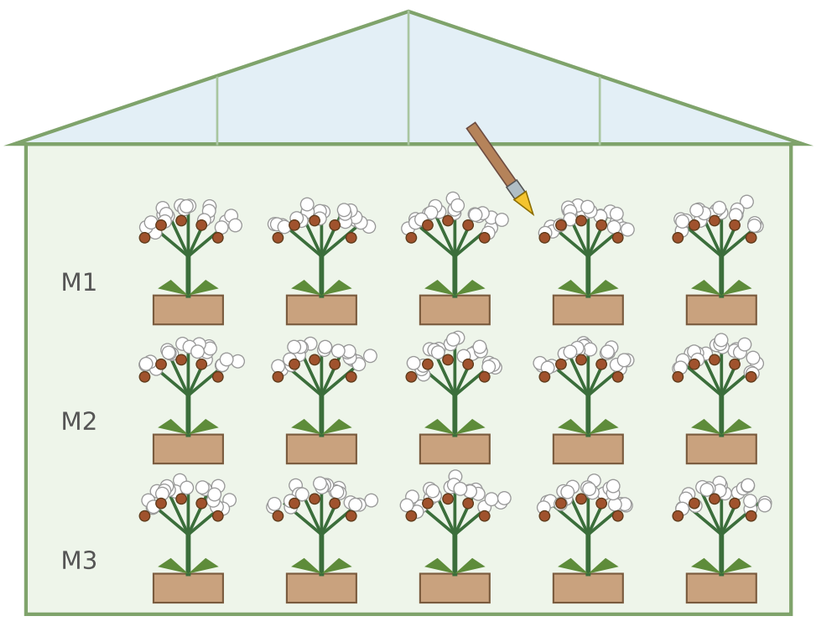

→ excluded as source

technique: seed set for plant size (see Figure 3)

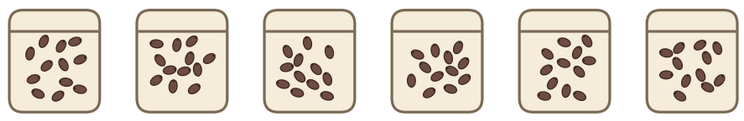

2. Multiply seed

from sources

many seeds

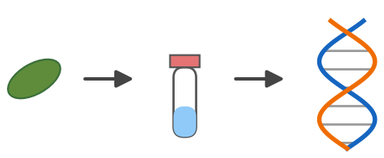

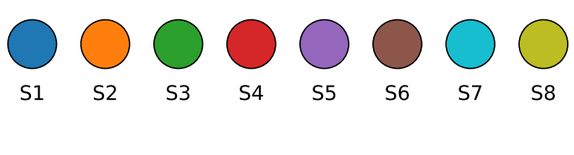

technique: seed bulking (greenhouse)

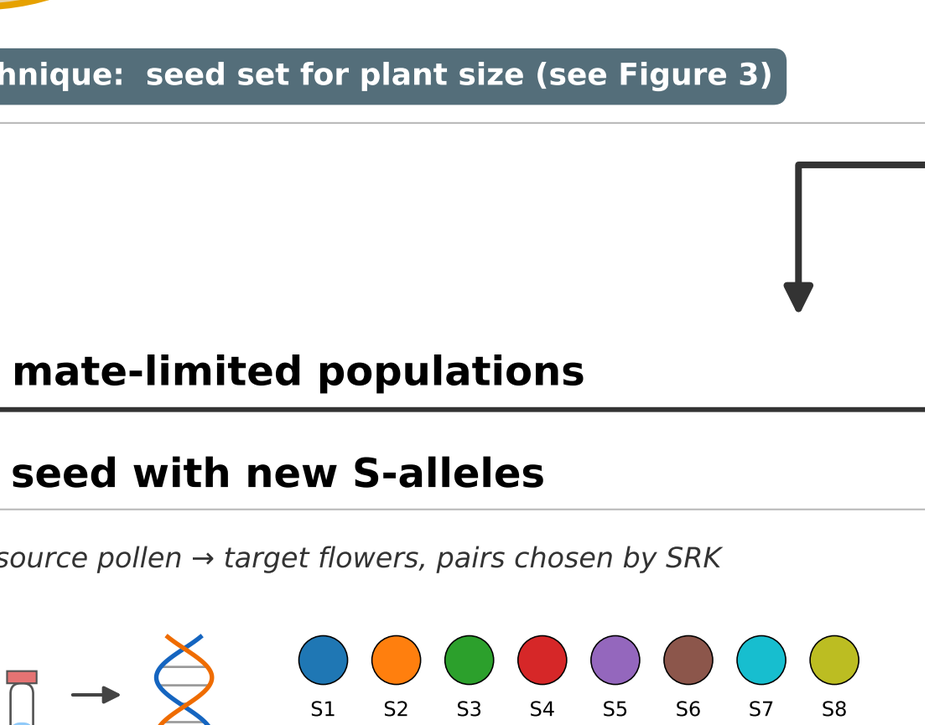

3. Rescue mate-limited populations

3a. Breed seed with new S-alleles

source pollen → target flowers, pairs chosen by SRK

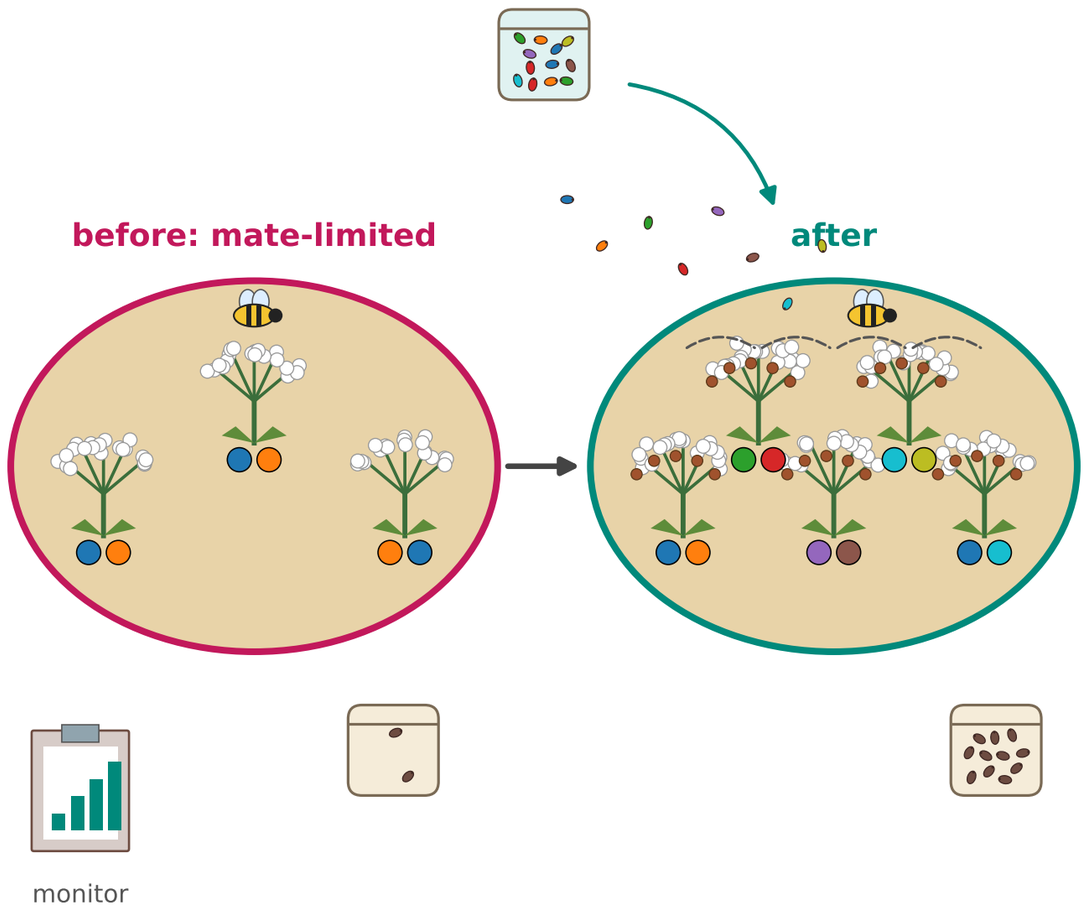

technique: informed breeding (SRK)

3b. Sow the seed into the population

technique: seed outcasting
