1. Prioritize populations for population restoration

reproductively intact (source)

top conservation priority: protect

mate-limited

→ rescue (objective 3)

rescue

over-producing

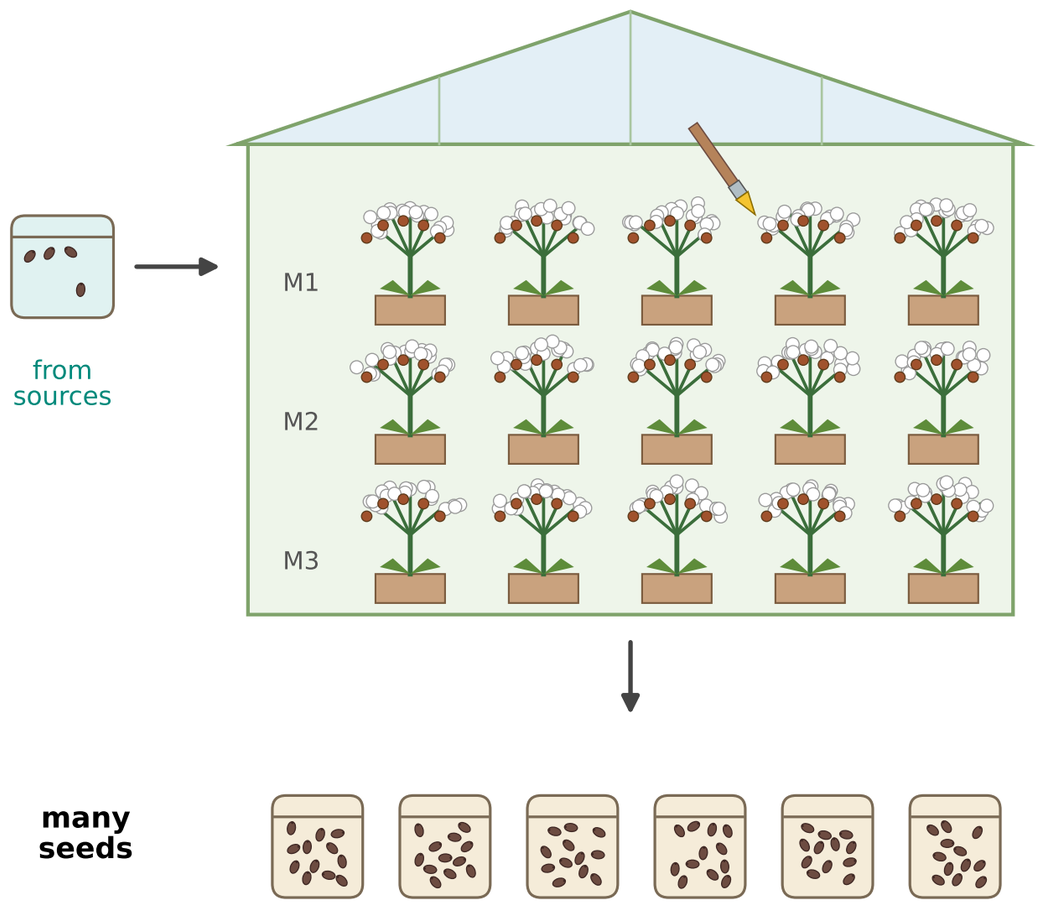

→ inbreeding depression: excluded as source

avoid

population = the plants that mate together (the mating pool)

technique: seed set for plant size (see Figure 3)

2. Multiply seed

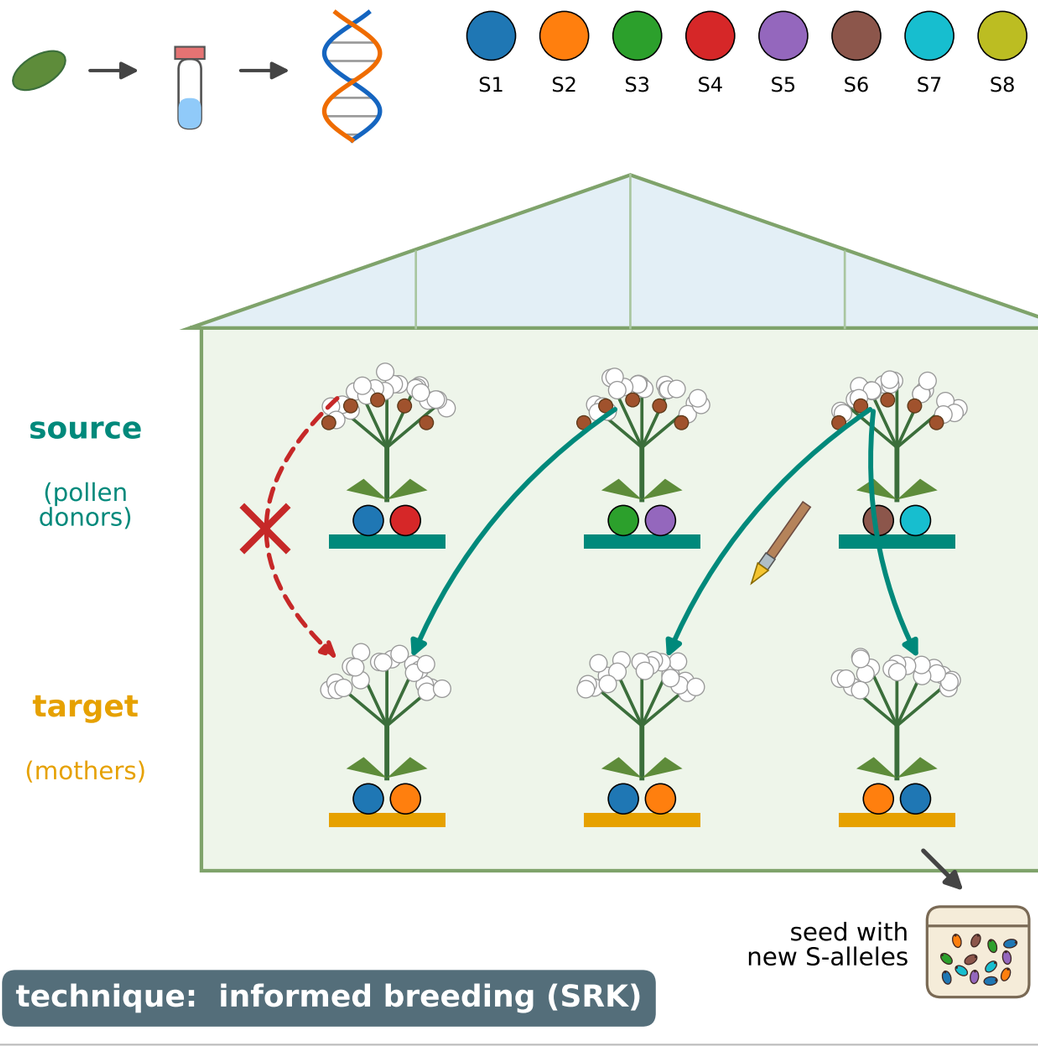

technique: seed bulking (greenhouse)

3. Rescue mate-limited populations

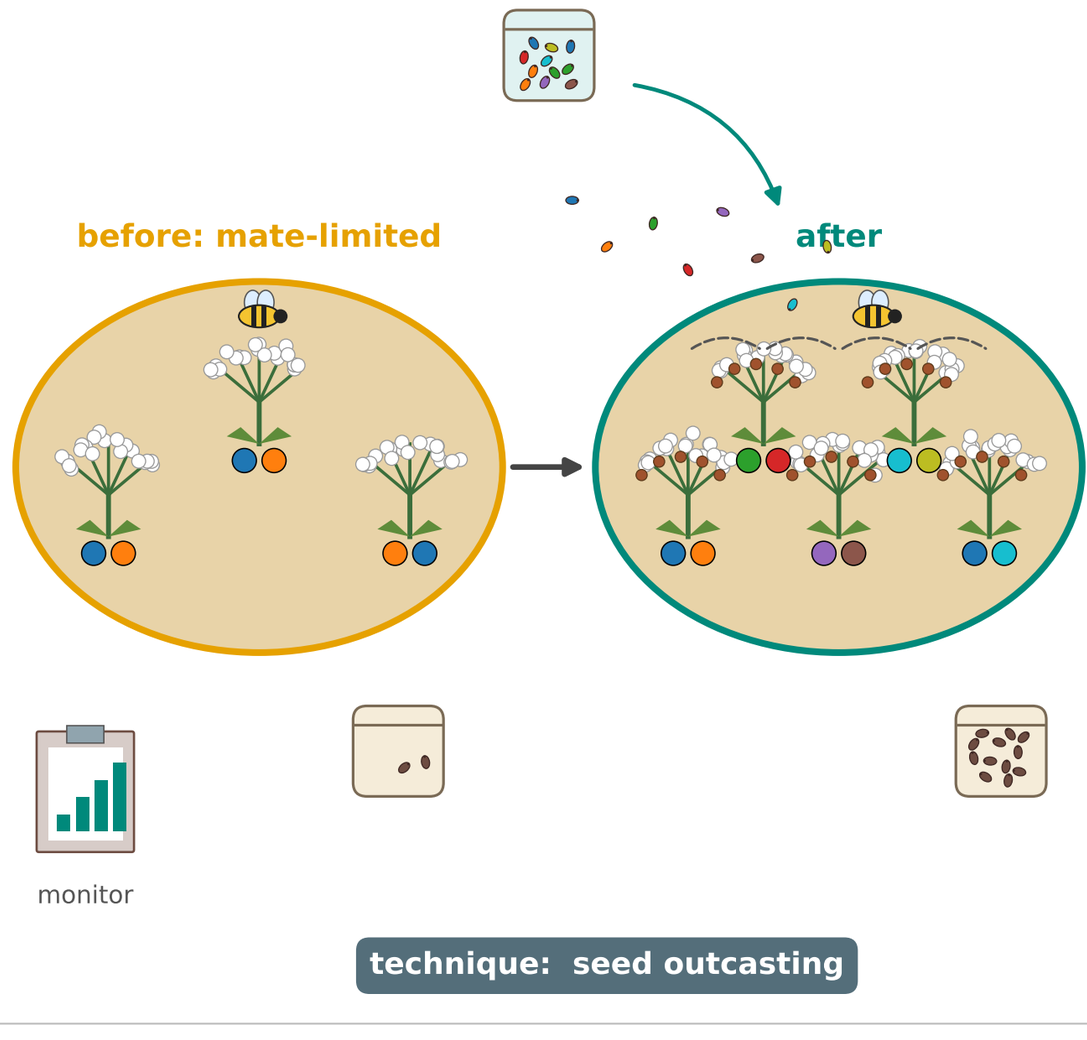

3a. Breed seed with new S-alleles

source pollen → target flowers, pairs chosen by SRK

technique: informed breeding (SRK)

3b. Sow the seed into the population

technique: seed outcasting
